Teachers Assistant AI:

Scenario: AI is everywhere now, and teachers are encouraging students to use it for learning. But it’s hard for them to know how students are actually using AI. The final submission only shows the end result, not how the student worked through the process and AI detectors aren’t always reliable, either.

Proposed Solution:

AI Agents read the teacher's chosen AI-use level for each assignment, coach’s students within that level (questions and feedback, no rewriting), records a short process summary of how AI was used, flag anything that seems different between their process and final work for the teacher to discuss with them and let the teacher make all decisions.

1.Assignment setup:The teacher picks an AI-use level (0 to 4) and uploads the rubric.

2.Student view: The assistant declines a rewrite request and asks a coaching question instead.

3.Process summary: sessions, revisions, and a "worth a conversation" note with the evidence shown.

4.Class dashboard: common weak spots and flag rates across student groups.

Agents Working:

Three agents share the work each with narrow permissions and the teacher makes every final decision.

Agent	What it does
Boundary Agent	Coaches students and holds the teacher's AI-use level even when pushed
Process Recorder	Logs drafts and AI interactions for that assignment only and tells students what is recorded
Teacher Insights Agent	Compares process with final work and flags cases with a conversation
